e: cdewhurst@bdo.com

We expect renewables to account for one-quarter of the world’s electricity generation by 2020.

Driverless technology, deep-sea excavations and mining expeditions on the moon were once just the ideas of sci-fi movies. Today, they’re realities or just around the corner. And by 2020, we expect (most of) them to be the norm.

As low commodity prices persist, mining companies are under pressure to reimagine their business models. Those that have incorporated technology into their operations have seen their revenue streams live on, while those that haven’t have fallen short.

Mining is in the early stages of the Fourth Industrial Revolution, or Industry 4.0, and further digitisation is on the horizon. The value of harnessing technology is obvious. Driverless technology increases mining output by 15 to 20 percent while cutting fuel and maintenance costs by 10 to 15 percent and 8 percent, respectively. It also improves mining safety exponentially. At the same time though, these Internet-connected technologies open the mining industry up to new cyberattack vectors that they must hedge against through proper internal controls. If not, they risk seeing their entire operation crippled by a single attack.

Decreased coal consumption in China—the world’s largest coal consumer—meanwhile, is slowing global demand for the commodity. As dependence on coal wanes, we expect renewables to account for one-quarter of the world’s electricity generation by 2020.

Reflecting on this period of transition, BDO’s Global Natural Resources team is looking towards the future to help mining companies anticipate and plan for the challenges and opportunities ahead. We believe that to prepare for success in 2020 and beyond, mining companies must strive to become “Lean, Green, Digital” machines.

The global predictions presented in this report are based on research and collective input from BDO’s Natural Resources and Mining leaders. In addition, the practice leaders from five countries (Australia, Canada, South Africa, the United Kingdom, and the United States) have provided predictions for the industry in their local markets.

SUMMARISING BDO’S ENERGY 2020 VISION FOR MINING:

1. ROBOTS:
   By 2020, robots will replace more than 50 percent of miners, and mining accidents will be cut by 75 percent. Half of the miners will themselves be retrained to run the technology controlling the robots.

2. EU CONFLICT MINERALS:
   Supply chain transparency will take the compliance spotlight for 2020 as companies gear up for the European Union’s Conflict Minerals Rule, effective in 2021.

3. CYBERSECURITY:
   By 2020, activist hackers will launch at least five cyberattacks on mines around the world in Permanent Denial of Service (PDoS) attacks aimed at eliminating the environmental and social threats they pose. They’ll use workers’ connected devices to initiate the attacks.

4. RENEWABLES:
   By 2020, renewables will account for one-quarter of the world’s electricity generation as dependence on coal wanes.

5. IoT IN MINING:
   Global mining companies leveraging Internet-connected sensors and automated drillers in mines will decrease their per ton digging costs by more than 30 percent.

Agree or disagree with our predictions? We want to know—reach out to us here.

BDO’S ENERGY 2020 VISION: THE NEAR FUTURE OF MINING GLOBAL PREDICTIONS
Robots will be at the forefront of most mineral extraction by 2020, reducing safety risks for miners, maximising output, and streamlining costs. By 2020, we predict robots will replace most miners. Most in the workforce will be retained, but advances in technology and remote mining equipment will transform what that workforce looks like.

The rise of the robot is not a death knell for the mining workforce but will inevitably lead to a demand for reskilling. Traditional operational positions—drilling, blasting, and driving—will be downsized, but replaced by demand for remote operators and maintenance personnel to create the new version of the miner. Emerging digital mining jobs—engineers, software developers, and data processing and data analytics specialists—are more likely to attract the technologically savvy millennial workforce. By 2020, mining automation and data analytics will be key components of the curriculum for mining engineers.

Digitisation also promises to reduce safety risks for miners. Not only will robots assume the most dangerous tasks, but they’ll also be key to minimising damage if disaster strikes. Snake robots and the smart sensors they’re equipped with will be further optimised to capture real-time data to predict or quickly identify equipment malfunctions and closely track miners’ exact locations and vitals. With the aid of robots and new technology, the number of mining fatalities will be cut in half by 2020.

Mining is in the early stages of the Fourth Industrial Revolution, or Industry 4.0, and further digitisation is just around the corner.
EU CONFLICT MINERALS RULE

The EU’s efforts to stem trade in minerals that finance armed conflicts and terror groups will turn a spotlight on global mining companies’ supply chains by 2020.

The EU’s Conflict Minerals Regulation, effective in 2021, establishes supply chain due diligence for imports of tin, tantalum, tungsten, and gold (3TG)—used to produce phones, cars, and jewellery. The rule aims to ensure European industries use responsibly-sourced minerals, stemming proceeds that finance armed conflict in high-risk areas.

What the rule means for the mining industry:

• EU-based 3TG importers and their international supply chain partners—smelters and refiners—will need to update their supply chain due diligence

• Additionally, 3TG importers in the EU will need to identify the smelters and refiners in their supply chains, confirm their due diligence practices comply, and report insufficient supply chain due diligence

• The Organisation for Economic Co-Operation and Development (OECD) laid out a five-step framework for the due diligence requirements:
  - Create strong company management systems
  - Identify and assess supply chain risk
  - Implement a program to respond to such risks
  - Conduct an independent third-party audit of supply chain due diligence
  - Submit annual reports on supply chain due diligence.

All upstream companies are subject to the due diligence requirements when they import—the riskiest area of the supply chain—as are downstream companies that import metal-stage products. This regulation will likely create a lowest common denominator effect across the global mining industry—for EU-based 3TG importers and their international supply chain partners—requiring the entire industry to put supply chain due diligence at the forefront.

TRANSPARENCY COMBATS CONFLICT PREDICTION 2
The mining industry is no stranger to environmental scrutiny. Advances in technology have introduced more sustainable mining methods, including the emerging practice of bioleaching, in which companies extract minerals by using biological assets instead of harmful chemicals. Despite those advancements, environmental concerns persist, including water and soil contamination, carbon emissions, and impact on animal life. Pressure from environmentalists is set to increase by 2020. In fact, an emerging type of environmentalist—activist hackers (hacktivists)—will soon have their targets locked on the mining industry. By 2020, there will be at least five Permanent Denial of Service (PDoS) cyberattacks on mines around the world, motivated by eliminating the environmental and social threats they pose.

**Prediction 3**

**Cybersecurity**

**By 2020, activist hackers will launch at least five cyberattacks on mines around the world in permanent denial of service (PDoS) attacks aimed at eliminating the environmental and social threats they pose. They’ll use workers’ connected devices to launch the attacks.**

PDoS attacks are the next generation of Distributed Denial of Service (DDoS) attacks—which temporarily disable operations—and aim for permanent destruction. In a PDoS attack, hackers’ goals include destroying physical equipment and structures, disabling services, and/or wiping out data. For global mining companies in the early stages of harnessing big data, losing seismic and reserves data would be damaging to their ongoing operations.

While the rapid acceleration and adoption of new technology will be instrumental in bolstering mining’s future, it will also be the sector’s Achilles heel when it comes to cybersecurity. The industrial control system, the central hub controlling a mine’s automated operations, could serve as the hacker’s point of entry into the mine’s remote operating controllers and connected devices. Damage and disruption to automated equipment could also jeopardise the safety of workers in the mines—as many of the systems in place are designed to monitor and detect dangerous conditions.
COAL STRIPPED OF SOME POWER
PREDICTION 4

RENEWABLES

By 2020, renewables will account for one-quarter of the world’s electricity generation as dependence on coal wanes.

Decreased coal consumption in China—the world’s largest coal consumer—is slowing global demand for the commodity. According to the International Energy Agency, global coal consumption decreased about 2 percent last year. In confluence with the rapid growth of renewables, the world’s energy mix is set for a shakeup. By 2020, we predict that renewables will grow to account for one-quarter of the world’s electricity generation as dependence on coal wanes.

Mining plays an integral behind-the-scenes role in developing renewable energy. Electric vehicles, wind turbines, and solar panels rely on minerals like aluminium, copper, lithium, and various emerging, rare metals. Powered by new technology, deep-sea mining is allowing mining companies to tap into previously inaccessible reserves of copper, nickel, and cobalt, among others, beneath the ocean floor to fuel increased demand for these minerals.

In 2019, Nautilus Minerals, a Canadian mining firm, is set to launch one of the first large deep-sea mining ventures in the Bismarck Sea with the aid of remote-controlled robots. The excursion is forecast to produce more than 72,500 metric tons of copper and more than 4.5 metric tons of gold. The International Seabed Authority, a United Nations regulatory body, has granted 25 contracts to nations including China, India, Japan, and Brazil to embark on similar deep-sea mining projects.

By 2020, further advancements will be made to overcome one of renewables’ largest hurdles: energy storage. The world’s largest lithium ion battery—built by Elon Musk in November 2017—is a 100-milliwatt (MW) battery storage farm located in Australia. Come 2020, the capacity of energy storage is likely to evolve well beyond 100MW, solidifying renewables’ role in the world’s energy mix.
In an environment of subdued commodity prices, the value of harnessing technology is clear. Mining companies’ end consumers closely monitor the price of commodities and are sensitive to the slightest uptick. For automakers, for example, steel is a significant expense on their books. When multiplied by a few thousand metric tons, a variance of a few cents on steel price could incentivise automakers to find a new supplier. Global demand is not expected to wane. In fact, steel and mining company ArcelorMittal forecasts a 36 percent increase to automakers’ global demand for steel by 2020. However, which global mining companies win that business is up for debate.

Tapping into new technology is key to streamlining operations, reducing expenditure, and enabling companies to keep their prices competitive. The International Institute for Sustainable Development estimates driverless technology, for instance, increases mining output by 15 to 20 percent, while decreasing fuel and maintenance costs by 10 to 15 percent and 8 percent, respectively. Self-driving trucks are just the tip of the iceberg. Global mining companies that digitise nearly all their drilling—relying on a combination of automated drillers and Internet-connected sensors—will recognise far more significant savings. By 2020, we predict global mining companies’ per ton digging costs will decrease by more than 30 percent because of automation. These savings factor in reduced labour costs, increased output, a decrease in the number of safety incidents, and companies’ ability to enhance decision-making capabilities leveraging the vast amount of data collected by smart mines.
BDO’S ENERGY 2020 VISION: THE NEAR FUTURE OF MINING IN SOUTH AFRICA
RETHINKING LIFE OF MINE MODELS

PREDICTION 1

Life of Mine (LOM) models will get a makeover by 2020.

Regulatory risk has been a feature of mining for many years, and LOM models have developed country-specific risk factors that affect the discount rates applied in the valuation models used for such purposes. This process of assessing country risk has been undertaken on a country-by-country basis and is largely driven by an assessment of the degree of political stability in a country.

We have witnessed increasing degrees of government regulation in areas that were previously assumed to be fairly stable. For example, new regulations relating to state ownership, royalties, and mining tenure in Tanzania have purported to supersede all the stability agreements that were entered into over the last 20 years. These were specifically designed to attract new investment in the mining sector in Tanzania.

Our prediction is that LOM modelling techniques will have to be refined to account for this factor via a more sophisticated approach to the historical data available and the general factors underlying this.
BREAKING BOUNDARIES FOR DEEP-LEVEL MINING

PREDICTION 2

QUICKENED DEVELOPMENT

BY 2020, DEEP-LEVEL MINING CHALLENGES WILL ACCELERATE THE DRIVE TO DEVELOP COST-EFFECTIVE ALTERNATIVES TO TRADITIONAL MINING PROCESS.

The health and safety issues associated with deep-level mining, paired with increased labour costs, will remain in the spotlight—but under a different lens.

Much has been written about mining being disrupted by digital transformation and new processes, but in this area, the degree of change, the cost of research, and the implementation of new technology is greater.

We believe that the easy wins have been achieved and are in the process of being implemented in areas such as metallurgical and stores systems. Replacing traditional drill and blast processes is in a different league and requires new solutions.

We predict the drive to develop cost-effective alternatives to traditional mining processes to continue. Long-term views on the cost/benefit analysis is key to justify introduction on a larger scale. However, the sustainability of mining operations will demand changes and increased technology. We expect that innovation and investment in this area will increase, but investors will wait to commit large sums until the various prototypes have been established as cost-effective solutions.
COMMUNITY ENGAGEMENT MODELS IN THE SPOTLIGHT

PREDICTION 3

SOCIAL LICENCE TO MINE

BY 2020, COMMUNITIES AROUND MINING SITES WILL HAVE A GREATER IMPACT ON COMPANY OPERATIONS THAN NATIONAL LEGISLATION.

Forget national legislation. By 2020, it will be the communities around mining operations that have the greatest say in a company’s right to mine.

With growing political risk factors, governments are increasingly intervening in mining regulation, which is contributing to more unpredictable valuations of mining projects, including rehabilitation expectations. Another trend we have seen is that community engagement models are playing an increasingly important role in establishing a company’s “social licence to mine”. All listed mining companies have sustainability reports that measure various factors relating to their operations, their impact on local communities, and their efforts to mitigate such impacts.

We predict that these trends will continue and that even if the mining company has complied with the national legislation affecting their operations, the communities around the mining areas will increasingly demand a say in a variety of areas. Some of the important areas will be the environmental impact and whether the area will be sustainable from an agricultural point of view in the future.

Community engagement models will become a bigger area of focus in feasibility and pre-feasibility studies and will have to be more carefully managed in the future.
