THE NEAR FUTURE OF OIL & GAS IN AUSTRALIA .......... 10
EXECUTIVE SUMMARY

The oil price collapse in late 2014 signified a fundamental change in the energy marketplace. While prices have rebounded from the low of $26 per barrel in 2016, the supply and demand dynamics that led to the downturn—a supply glut due in large part to U.S. shale and stagnating growth in global demand—are here to stay. Efforts to rebalance the markets have helped inventory levels recover, but those efforts are contingent on key producers limiting output. Gone are the days when success was linked almost exclusively to high production volumes and growing reserves.

It’s the confluence of trends—not just the new pricing paradigm, but rapid growth in renewables along with accelerating technology advancements—that is reshaping the industry. The energy company of the future is one that has successfully figured out how to cut costs, enhance operational efficiencies through digital and technological transformation, and diversify its portfolio to include alternative energy sources.

Reflecting on this period of turmoil and transition, BDO’s Global Natural Resources team is looking towards the future to help oil & gas companies anticipate and plan for the challenges and opportunities ahead. We believe that to prepare for success in 2020 and beyond, oil & gas companies must strive to become “Lean, Green, Digital” machines.

The global predictions presented in this report are based on research and collective input from BDO’s Natural Resources leaders around the world. In addition, the practice leaders from five countries (Australia, Canada, the United States, the United Kingdom, and the Kingdom of Saudi Arabia) have provided regional predictions for the industry in their markets.

SUMMARIZING BDO’S GLOBAL ENERGY 2020 VISION FOR OIL & GAS:

1. OIL PRICES:
By 2020, low oil prices—expected to remain at or below the $60 per barrel mark—will spur Gulf Cooperation Council countries to diversify their energy mix within the power sector using auctions to subsidize renewable energy projects.

2. CYBERSECURITY:
By 2020, at least five countries will see foreign hackers take all or part of their national energy grid offline through Permanent Denial of Service attacks.

3. GLOBAL ENERGY TRADE:
By 2020, the growth of LNG imports and solar power will bring electricity to four in five African people.

4. INVESTMENT IN TECH:
While overall spending on R&D may decline, most of the spending that does occur will go towards technologies that enhance exploration and production (E&P) efficiencies.

5. DATA DEMOCRATISATION:
By 2020, the average E&P company will make use of 10 percent of its big data—up significantly from today, but nowhere near full potential.

Agree or disagree with our predictions? We want to know — reach out to us here.

Ready or not, the global oil & gas industry must contend with an ever-changing ‘normal’.
BDO’S ENERGY 2020 VISION:
THE NEAR FUTURE OF OIL & GAS
GLOBAL PREDICTIONS
The pressure is on for GCC countries—Saudi Arabia, Kuwait, the United Arab Emirates, Qatar, Bahrain, and Oman—to diversify away from oil, especially when it comes to electricity production. The rising domestic demand for oil, especially in the power sector, is hindering the GCC countries’ ability to export oil and causing their economies to contract. In October 2017, the International Monetary Fund (IMF) cut the 2018 GDP forecasts for the GCC states from 2.5 percent to 2.2 percent. Non-oil related economic growth is expected to reach 2.4 percent in 2018—well below the 6.7 percent average seen from 2000-2015. Oil-exporting countries across the broader region saw their fiscal deficits skyrocket from 1.1 percent of GDP in 2014 to 10.6 percent of GDP last year.

GCC countries’ current trajectory is unsustainable. Most have already begun importing LNG because of the shortage in cheap natural gas, further underlining the need for efficient, non-hydrocarbon energy sources in the area. Countries are starting to make renewables realistic through auction-based approaches to subsidies. Through auctions, countries set a target level of investment in renewables and allocate contracts to the most cost-effective bidders. Almost 50 countries have adopted this approach, and almost 30 additional countries are considering following suit. Although GCC countries have set targets for deployment of renewables at the national or local level, the region has seen little deployment. By 2020, we predict that relatively low oil prices will spur GCC countries to diversify their energy mix within the power sector. As utility-scale installed solar and wind costs continue to decline, they will use renewable energy auctions to begin reaching their deployment targets.

OIL PRICES

BY 2020, LOW OIL PRICES—EXPECTED TO REMAIN AT OR BELOW THE $60 PER BARREL MARK—WILL SPUR GULF COOPERATION COUNCIL (GCC) COUNTRIES TO DIVERSIFY THEIR ENERGY MIX WITHIN THE POWER SECTOR, USING AUCTIONS TO SUBSIDISE RENEWABLE ENERGY PROJECTS.
ATTACK AGAINST THE GRID: A DRESS REHEARSAL FOR WHAT’S TO COME?

PREDICTION 2

CYBERSECURITY

BY 2020, AT LEAST FIVE COUNTRIES WILL SEE FOREIGN HACKERS TAKE ALL OR PART OF THEIR NATIONAL ENERGY GRID OFFLINE THROUGH PERMANENT DENIAL OF SERVICE (PDOS) ATTACKS.

The advances in technology that allow the energy industry to create new efficiencies and innovations at the same time require connectivity that leaves power grids around the world more vulnerable to cyberattacks.

Several electric grids around the world have already come under threat in recent years, most through Distributed Denial of Service (DDoS) attacks. In 2015, an attack on a grid in the Ukraine temporarily cut power to more than 200,000 people. A subsequent attack occurred just a year later, reportedly carried out by Russian actors. In May 2017, officials from the Baltic states—which are connected to Russia’s power network but plan to move to the European Union’s grids—said their power grids were targeted by Russia through a series of DDoS attacks.

“On a daily basis there are DDoS attacks designed to probe network architecture, so it could well be possible that something (serious) could take place later on,” a NATO official told Reuters.

Any disruption to a country’s electric grid would have serious implications for virtually all industries, especially critical ones like healthcare, transportation, security, and financial services. Since 2011, a dedicated and sophisticated group of cyber attackers known as Dragonfly has been targeting the energy sector in Europe and North America. The group has used Trojanised software, spear phishing emails and watering hole websites to gather intelligence with the potential for sabotage.

While the number of total DDoS attacks decreased by 18 percent year-over-year in Q2 2017, there was a 19 percent increase in the average number of attacks per target. This could indicate that the quantity of DDoS attacks may be waning, but the severity of each attack is increasing.

WE PREDICT THAT TODAY’S ATTACKS ON THE GRID ARE A DRESS REHEARSAL FOR A MUCH MORE MALICIOUS TYPE OF ATTACK: PDOS. BY 2020, AT LEAST FIVE COUNTRIES WILL SEE FOREIGN HACKERS TAKE ALL OR PART OF THEIR ENERGY GRID OFFLINE WITH THE INTENT TO DESTROY IT.
Africa represents 16 percent of the world’s population but just 32 percent, or 1.5 in 5 African people, have access to electricity. The growth of liquefied natural gas (LNG) could change that.

While many governments in Africa, especially in sub-Saharan Africa, have intensified efforts to invest in domestic energy production, inadequate energy infrastructure has stood in their way. Two out of every three dollars invested into the sub-Saharan energy sector since 2000 have been used to develop energy to be exported rather than for local consumption.

LNG expansion is forecast to help natural gas demand outpace demand for oil and coal through 2040. Africa presents an opportunity for LNG producers to find new sources of demand.

Electricity in Africa has remained expensive—a particularly difficult barrier for its population. However, as noted by the Africa Energy Outlook, “huge renewable resources remain untapped,” with further potential from excellent solar capabilities across all of Africa. Foreign solar companies have taken notice and have installed solar microgrids or home-based solar systems across sub-Saharan Africa. At the same time, African countries have begun building import facilities for LNG, including a facility in Ghana—the first import facility in the sub-Saharan market. The continued growth in solar power across Africa could improve the wider energy infrastructure, creating a ripple effect and attracting foreign LNG exporters to invest in pipeline construction, a further boon to their business.

Renewable energy has begun to help more Africans turn and keep the lights on, and LNG exporters—and their investors—will follow this initial track. By 2020, we predict that the growth of LNG imports and solar power within Africa will bring electricity to four in five people on the continent.
INVESTING IN TECH TO KEEP THE LIGHTS ON

PREDICTION 4

INVESTMENT IN TECH

WHILE OVERALL SPENDING ON R&D MAY DECLINE, MOST OF THE SPENDING THAT DOES OCCUR WILL GO TOWARDS TECHNOLOGIES THAT ENHANCE EXPLORATION AND PRODUCTION (E&P) EFFICIENCIES.

As downward pricing pressures rage and with much of the world’s easy-to-reach oil already consumed, oil & gas companies are tasked with producing more with less—or risk shutting their doors. To accomplish this, energy companies, historically slow to do so, are investing in new technologies to increase operational leanness while boosting profit margins.

Technology is present throughout the energy supply chain, from locating oil wells and extracting reserves to refining and transporting the commodity. Oilfield services companies like Halliburton and Schlumberger note that their customers already use high-tech equipment and data analytics to determine whether a well will produce enough oil to make it economic—before the drilling begins. Others are using more advanced technologies to “refrac” wells originally drilled using less advanced technologies to extend their shelf life and further capitalise on them. When it comes to new wells, engineers use software and sensor technology to determine the right combinations of chemicals, sand, and water to maximise extraction. When deciding where to drill, E&P companies already rely on a combination of Monte Carlo simulations and 3D seismic surveys to generate 4D seismic imaging and project future physical changes to the oilfield and reservoir. Using current technology, the industry has about an 80 percent overall drilling success rate.

While oil & gas companies have in the past been labelled “low R&D intensity,” investing less than 1 percent of net revenue in R&D, spending on innovation and R&D has increased notably over the last few years.

Investing in innovation is the first step towards global oil & gas companies reducing expenditures while maximising production and maintaining margins. By 2020, while their overall R&D spending may decline, oil & gas companies will put most of their remaining dollars into technologies that boost E&P efficiencies in an effort to do more with less.
As the adoption of new technologies quickens, the upstream sector’s access to data will grow exponentially. Under the pressure of subdued oil prices, the ability to tap into that data becomes a lifeline.

Upstream companies place tens of thousands of data-collecting sensors within wells and surface facilities to monitor assets and environmental conditions in real time. When used correctly, data can create efficiencies across the entire E&P process—from locating and extracting hydrocarbon to arranging for delivery to trucks and pipelines for transport and refinement. In the discovery stage, E&P companies can use data analytics to analyse year-on-year geological survey data to determine the best places to drill. During the drilling phase, drill bit and rig technology can track progress continuously and create more accurate and safer drilling processes. When it comes to extraction, data can be analysed to conduct predictive maintenance on wells and determine whether certain wells should be re-fracked.

While most E&P companies have adopted new technologies, they still lack the data analytics capabilities needed to extract the maximum value of that data. Upstream companies are often unable to integrate different sources of data, and information gathered from different datasets is left in silos, unavailable to decision-makers who need it most. Technology companies providing the data infrastructure are often unaware of how to apply the analytics tools to the oil industry effectively. As a result, most data collected from upstream operations, while it may be used for issue detection and control, is never used for performance optimisation. The average offshore rig has 30,000 data-generating sensors, but less than 1 percent of that data is analysed and used in decision-making.

As tech companies begin to partner more with the E&P sector, we expect innovation to accelerate and better data integration across organisations to take shape. By 2020, we predict the average E&P company will make strides towards data democratisation, making use of 10 percent of its big data—up notably from today, but still nowhere near full potential.
BDO’S ENERGY 2020 VISION:
THE NEAR FUTURE OF OIL & GAS
IN AUSTRALIA
Australia is the world’s second-largest LNG exporter behind Qatar. Over the last decade, Australia has made significant investments (more than $200 billion) in major capital projects. Cost overruns and delayed schedules have caused a plateau in investment by the oil & gas super majors, which will create opportunities for small to mid-sized players and large domestic players to enter the market and build market position. Smaller floating liquefied natural gas (FLNG) technology will be one mechanism to achieve this through commercialisation of stranded gas fields.

Seeing the opportunity, oil & gas majors will maximise the value of existing assets and returns from significant LNG investment. Expansion projects will likely be in the pipeline by 2020, further driving shareholder return. Lessons can be learned from companies that developed Australia’s significant LNG projects, including Wheatstone, Gorgon Project, and Ichthys. These will ultimately drive expansion by leveraging the existing base projects and infrastructure, and established regulatory approvals and hubs. This will allow for additional LNG trains and processing off the Western Australian coast.

Whilst the US is currently the world’s largest producer of gas, the political risk under the Trump administration will amplify Australia’s footprint in the LNG market, appealing strongly to Asian buyers, including Japan, China, and India.
The gas shortages on the east coast of Australia have become a major political issue for the government. The key decision currently under debate surrounding investment in the transcontinental gas pipeline will likely come to fruition. The highly speculative venture will connect Western Australia to the east coast gas hub at Moomba in South Australia, providing an industry-led solution to the east coast gas shortages and catering to large industrial consumers and households.

The Australian Federal Government will support investment in unconventional gas projects on waterways and wind back regulations for development of onshore gas for the domestic market. As part of the solution to address the gas supply shortfall, current LNG infrastructure in Western Australia will be used as the source of LNG imports into the east coast.

**GAS SHORTAGES FUEL UNCONVENTIONAL PROJECTS**

**PREDICTION 2**

**MAXIMISING INFRASTRUCTURE**

**BY 2020, LNG INFRASTRUCTURE IN WESTERN AUSTRALIA WILL BE THE SOURCE OF LNG IMPORTS INTO THE EAST COAST.**
ATO TRANSFER PRICING SETTLEMENT SHINES A SPOTLIGHT ON OIL & GAS COMPANIES

PREDICTION 3

REGULATORY SPOTLIGHT

BY 2020, REGULATORS WILL DEMONSTRATE GREATER SCRUTINY AND SURVEILLANCE OF OIL & GAS COMPANIES.

The success of the Australian Taxation Office (ATO) in the transfer pricing dispute with multinational oil giant Chevron will be a precedent for Australian authorities to pursue multinational oil & gas companies. Regulators will also have stronger positions in enforcing anti-bribery legislation, such as the US Foreign Corrupt Practices Act (FCPA) and UK Bribery Act, leading to a new revenue source for governments.

The success of the Chevron case will also encourage the ATO to increase surveillance on the debt funding of Australian investments by foreign multinational enterprises in the future. The implications will extend beyond the major players, including smaller and mid-cap organisations and will drive significant revenue back to the Australian government.

By 2020, there will be record fines and settlements being paid by oil & gas companies.
REDEFINED TRADE FLOWS FUEL NEW FINANCING METHODS

PREDICTION 4

REDEFINED TRADE FLOWS

BY 2020, THERE WILL BE A SHIFT IN ECONOMIC ACTIVITY WHICH WILL REDEFINE TRADE FLOWS AND CALL FOR NEW METHODS OF FINANCING NEW PROJECTS.

As Europe, Russia, and Asia become more intertwined, we predict that consumers will push towards shorter-term contracts. There is already widespread speculation that many Asian customers are seeking arbitration and shorter-term contracts to provide flexibility, thus fuelling the desire for “micro” projects. Micro projects require less capex and long-term capital commitment carrying lengthy contracts that underpin the development process. There will be a proliferation of small and short-lived oil fields, no longer dominated by multinational organisations, which will provide flexibility to customers and to operating companies.
ETHICAL SOURCING WILL LEAD TO MANDATED TESTING

PREDICTION 5

PROOF OF ORIGIN

BY 2020, ALL OILS WILL BE SUBJECT TO PROOF-OF-ORIGIN TESTING.

The heightened focus on ethical sourcing of products, along with the import and export sanctions such as those in place on North Korea and Qatar, will lead to a mandate on “proof-of-origin” testing for oil production.

A secure, complex method of identifying oil and fuel production will be the key enabler, with technologies such as graphene quantum dots already being used to trace shipments that contravene international sanctions. Graphene quantum dots fluoresce and can be configured with a specific spectrum assigned to a particular well or producer. Such technologies may also assist with auditing production sharing contracts.
